

# A SATELLITE ESTIMATION MODEL FOR SOLAR ENERGY RESOURCE ASSESSMENT IN CHILE

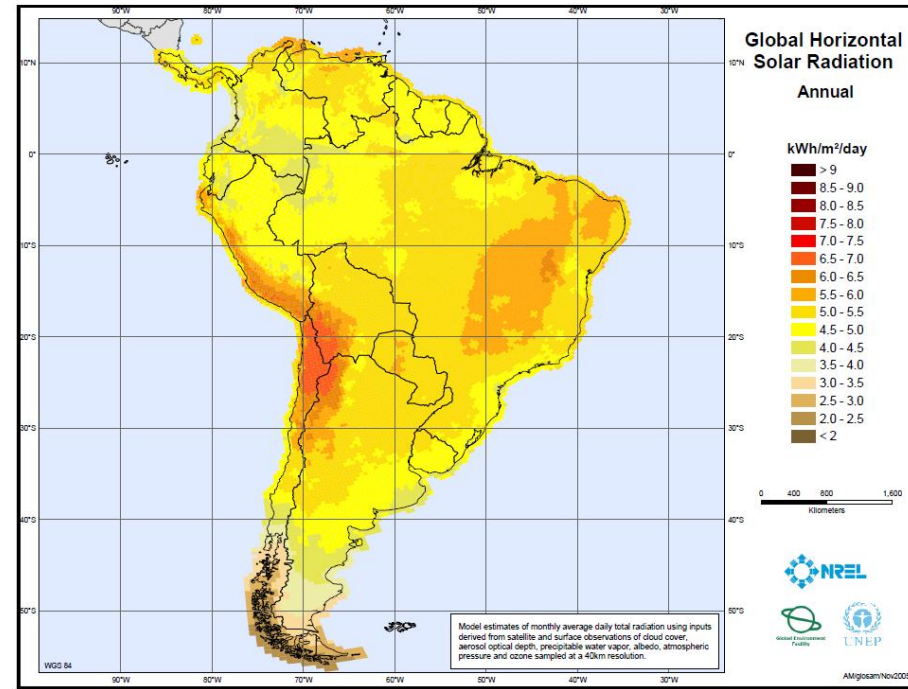

## Model CHILE-SR

# Motivación

# Major Goals

- Solar energy resource assessment for Chilean territory
- Develop suitable methodology for the climatic and environmental characteristics of the Chilean territory

# Model Chile-SR

# Topography database

## DEM files provided by USGS

# Input Data

## Climate data

- Maps for the following climate variables were prepared at the same spatial resolution of satellite images:
  - Air Temperature
  - Surface Albedo
  - Relative Humidity
  - Atmospheric Visibility
- Methodology used for Air temperature and RH:
  - temporal series acquired at ground site managed by DMC
  - determination of monthly mean values for each ground site
  - Geostatistical interpolación (Kriging)

# Air Temperature

# Relative Humidity

June

December

# Input Data

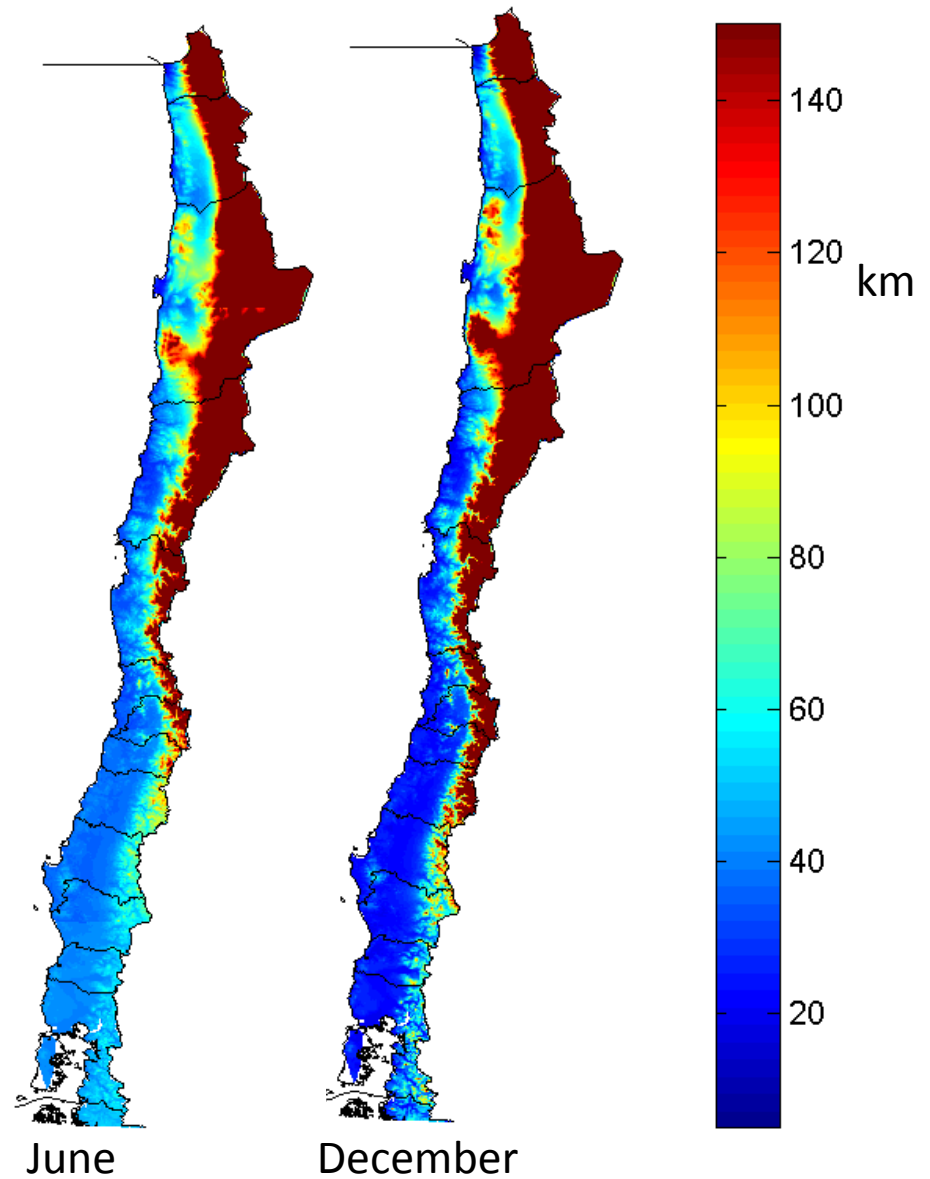

## Climate data

- Surface Albedo:
  - obtained from MCD43C3 MODIS product provided by NASA
- Atmospheric Visibility:
  - due to the scarcity of ground observations for Chile, global database were used: values between 5 and 50 km were corrected by altitude, using the empirical formulation

# Surface Albedo

# Visibility

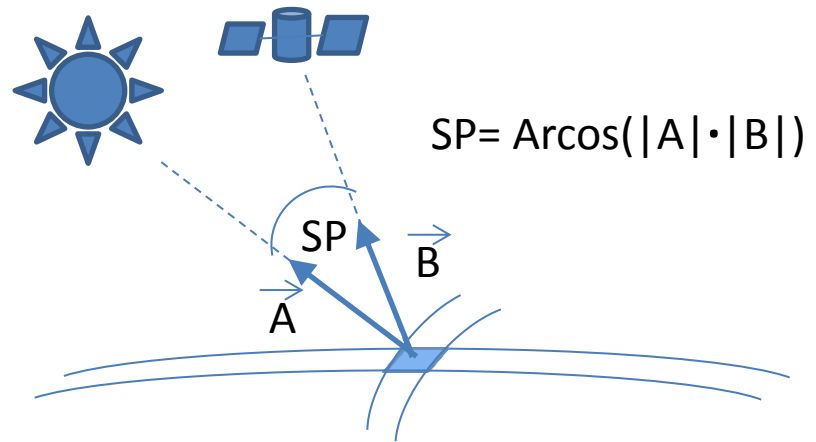

# Input Data

## Cloud cover index from satellite images

- Satellite: GOES 13
- Each data file provides information on:
  - Visible Radiance
  - Infrared Radiance
  - Latitud
  - Longitud
  - Scatter phase

	Visible data	Infrared data
Spatial resolution	1 km	4 km
Spectral Range	0,5 $\mu\text{m}$ – 0,7 $\mu\text{m}$	10,2 $\mu\text{m}$ – 11,2 $\mu\text{m}$

# Input Data

Cloud cover index from satellite images

19/10/2012 14:40 horas

# Input Data

## Cloud cover index from satellite images

- Three steps
  - Supervised training
  - Pattern recognition
  - $CCI_{eff}$  determination

# Supervised Training

- Expert knowledge to identify classes manually

Sky condition	Visible channel	IR channel
Clear Sky	Opaque	Opaque
Cloudy sky	Half-bright	Half-opaque
	-	-
	Bright	Bright
	-	-
	Opaque	Bright

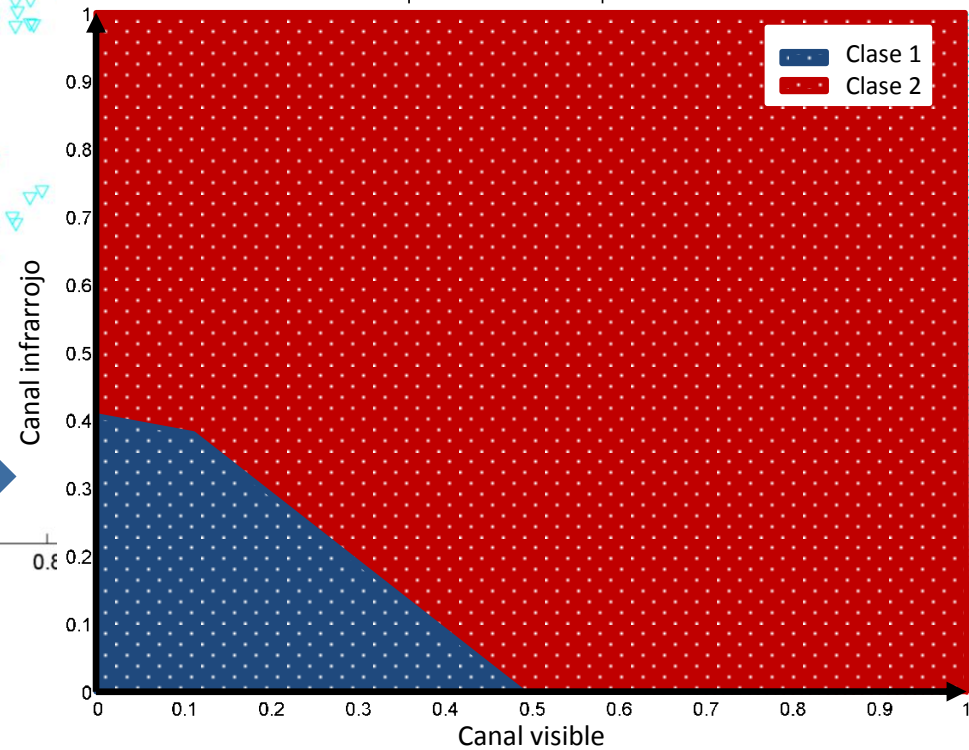

Canal 1

# Pattern Recognition

LDA classifier is used to identify areas

# CCI<sub>eff</sub> determination

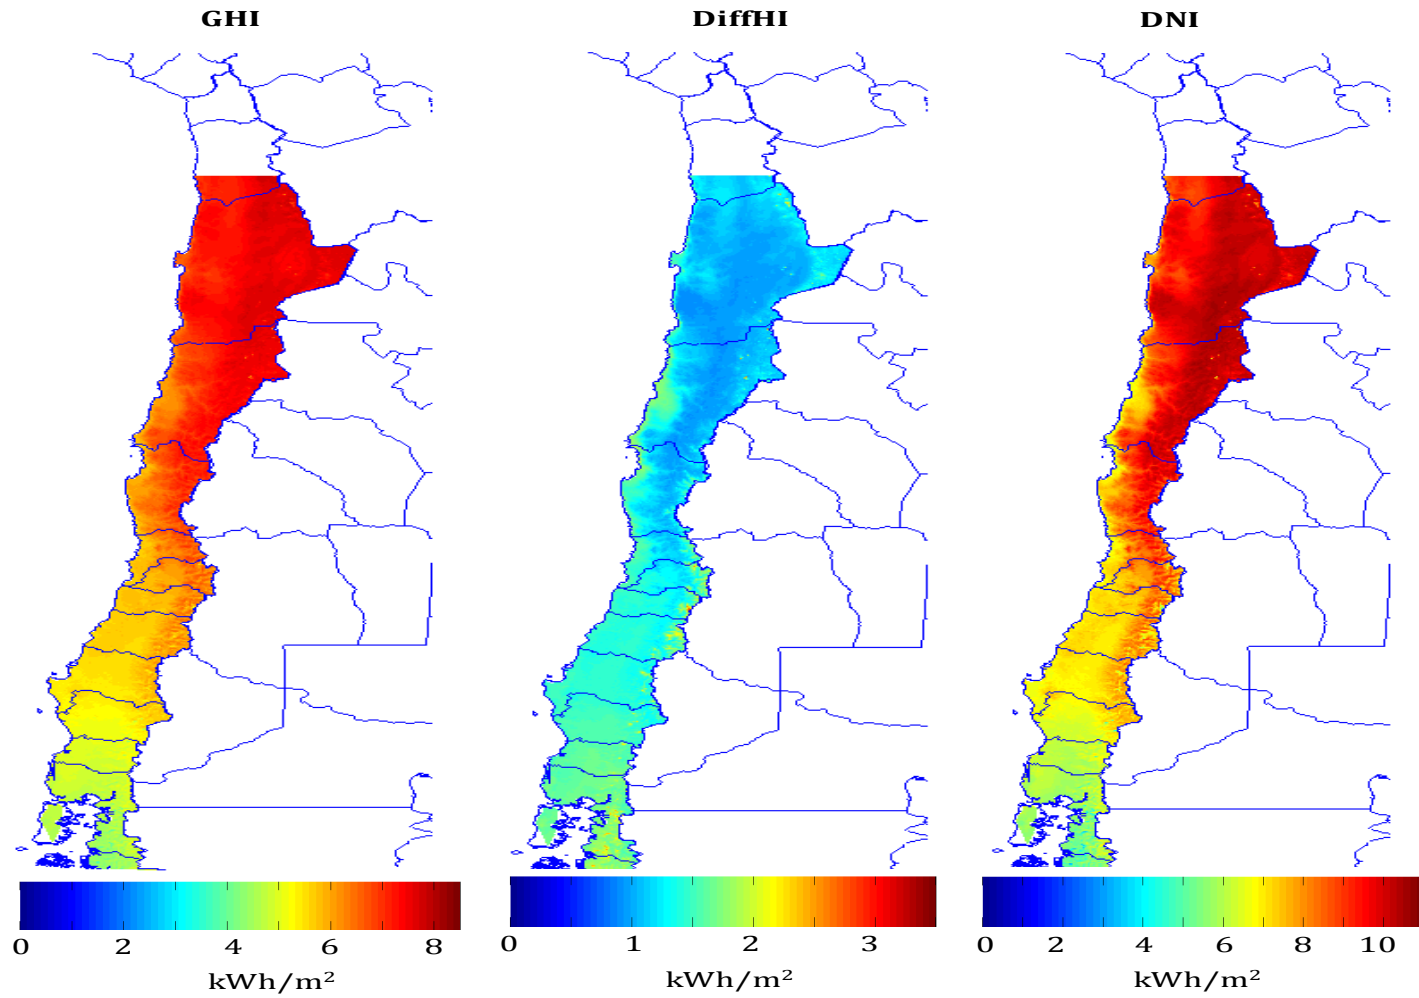

- $L_{clear}$  : the visible radiance related to clear sky condition for each pixel
- $L_{cloud}$ : the visible radiance for cloud sky related to Satellite/Pixel/Sun geometry (SP angle)

$$CCI_{eff} = \frac{L - L_{clear}}{L_{cloud} - L_{clear}}$$

# CCI<sub>eff</sub> determination

# Results

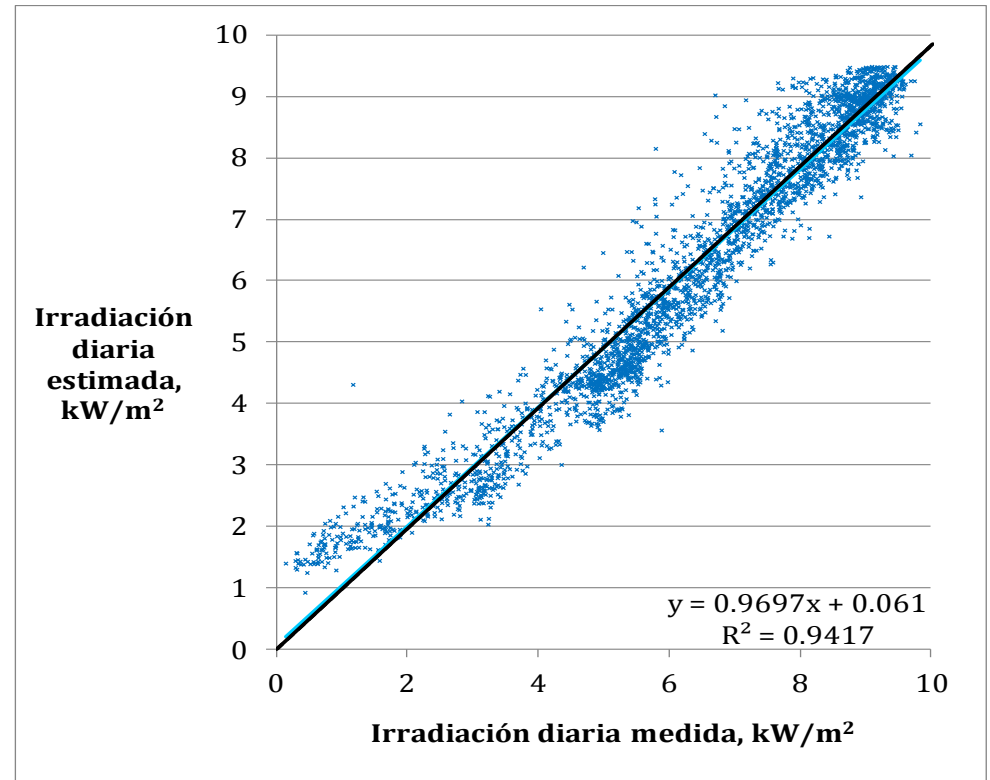

# Ground Data Network

Nombre	Localización	Altitud	Región	Tipo de estación	Período de operación

# Conclusions

- The model CHILE-SR was able to simulate the typical atmospheric radiative processes for Chilean territory
  - good agreement between observations and estimates
  - Bias lower than 2%
  - RMSE around 9% for daily total data and 13% for hourly data
- The larger solar energy resource is available in the Northern region at the Atacama Desert where the energy demand is large due to mining industry
